

1. Core Mechanic that defines how BeReal works:

BeReal's core mechanic is a daily-prompted, limited-window post designed to encourage daily participation, promoting authentic social interactions.

2. One specific feature or interaction that you think is genuinely effective. Why does it work and what does it make the user feel or do?

The two-way post feature allows users to capture a picture with the front and back camera in a single post. Without this feature, users have to share separate posts to show the surrounding and their reaction or have to decide one of these angles to share. Using this feature, users can share their situation and their reaction to the situation at once. Users are encouraged to post because this feature allows them to share more context and explore a different way of capturing moments. Their sharing experience feels more genuine and personal because users can share a fuller picture of the moment.

3. Name a friction point - a moment where the app loses you, confuses you, or makes you less likely to come back. Be specific about the moment, not just the feeling.

The two-way picture feature requires users to click both the angles at once. While trying to capture both the front and back cameras, the user can get frustrated trying to position both cameras for one shot. Users may decide to skip posting that day or become less likely to post due to this friction point.

4. Based on the friction point you identified: if BeReal fixed it, what would happen to monthly active users? Make a prediction.

Introduce an option where the user can click the front and back camera pictures separately along with the original feature of clicking both at once. Monthly active users are likely to increase because users who skip posting due to the frustration of being unable to position both camera frames at once may resume posting due to this added flexibility. Increased posting is likely to improve user retention and increase the number of users who remain active throughout the month.
